

Howard Fletcher & Sakib Jamal's **Project Proposal**

Project Framing

Topic – 1. Digital Health & Mental Health Platform.

Audience – Students pursuing education at a collegiate level.

Project Goal – The goal of our project is to simplify the work students must do to get all their work in order. By housing all the relevant documents and necessary information in one place, students can utilize this application to help stay on top of their large workloads, all while being notified as they choose to be. An application that compacts the necessary information of various obligations into an easy-to-use and aesthetically pleasing planner.

Core Build (main feature)– A calendar that goes granular to the hour, allowing students to place necessary information about deliverables, meetings, or other events at accurate times.

Secondaries (other two features) - The first will be login functionality, ensuring users can save their specific timetables for future customization and reference.

Research & Content

References – Applications like Apple's Calendar and Reminders app are being used as a reference to plan necessary features and functionality.

Content Inventory (plan for each page) -

Page 1. A login or sign-up screen, prompting the user to make a secure account.

Page 2. The planner screen will display all registered, upcoming events.

Page 3. Notifications screen where users can configure how often they'll be notified.

Page 4. A Settings screen where users can customize the appearance of their application.

Visual Direction & Hierarchy – Planner will be presented in tiles, like Apple's Calendar application, complete with light animation to make information more legible.

Responsive Strategy

Advanced Responsive Design – Ensuring that the application scales adequately for desktop and mobile devices. Style should be consistent across all devices. It's important that parts of the planner remain scalable for user customization and accessibility.

Likely Layout Risks & QA Checks – Desktops and mobile devices come in various sizes. As the layout for the application will also be customizable (font-size, etc.), it's important the product is tested on a variety of applications.
